REDUCE STORM WATER POLLUTION

AUTO CARE

Polluted runoff is the biggest threat to clean public water, and properly taking care of your vehicle can go a long way in preventing it. Being smart with how you maintain your car can help protect our drinking water supply.

TIPS TO PREVENT POLLUTED RUNOFF

- **Properly store your automotive fluids** like oil and gas cans where they are less likely to spill.
- **When washing your car, use commercial car washes** that recycle water for multiple uses and have proper channels to discharge dirty water.
- **Check your vehicle for leaks** that could let automotive fluids into the water supply while driving.
- **Clean spills with sand or other absorbent material** to avoid washing it into the water supply.

*Keep our waterways safe by being proactive
about your automotive fluids!*
